

# Arvy Heuristics for Distributed Mutual Exclusion

*Silvan Mosberger*  
*Advised by Pankaj Khanchandani and András Papp*

# Distributed Mutual Exclusion

Single shared resource in network of nodes wanting exclusive access to it

# Distributed Mutual Exclusion

Single shared resource in network of nodes wanting exclusive access to it

# Local Pair Distance Minimizer

# Dynamic Star

For known probability distributions, there is a best star 2-approximation of the optimum<sup>1</sup>

## Idea

- ▶ Measure frequency of requests for each node
- ▶ Choose node with best estimated performance as star center

---

<sup>1</sup>Peleg

# Dynamic Star

# Dynamic Star

# Results

- ▶ Graph weights: Euclidean distances between uniformly random points in a unit square
- ▶ Requests: Random or adversarial
- ▶ Performance: Total time needed to satisfy all requests

# Tree Behavior

# Tree Behavior

# Best Heuristic for Random Requests

# Best Heuristic for Adversarial Requests

# Conclusion

- ▶ Arrow with the best star is very good for uniformly random requests
- ▶ The Dynamic Star heuristic outperforms all others for adversarial requests
- ▶ The Local Pair Distance Minimizer heuristic has decent performance and interesting properties

Thanks for your attention

# Best Tree for Arrow

# Ivy in Small Cliques

Average request completion time between Arrow and Ivy in small cliques:

Node count	Arrow	Ivy
3	1.334	1.250
4	1.499	1.443
5	1.600	1.603
6	1.665	1.739
7	1.713	1.859
8	1.749	1.963
